

SFP-TX  
 1000BASE-T SFP Transceiver  
 10/100/1000M SFP Transceiver

**Product Features**

- ✓ Up to 1.25Gb/s bi-directional data links
- ✓ SFP form with compact RJ-45 connector
- ✓ +3.3V single power supply
- ✓ 0 to 70 °C operating case temperature
- ✓ Intelligent Auto-Negotiation support for automatic duplex, speed, and flow control resolution
- ✓ 10/100/1000 BASE-T operation in host systems with SGMII interface
- ✓ Fully metallic enclosure for low EMI
- ✓ Access to physical layer IC via 2-wire serial bus
- ✓ RoHS compliant and Lead Free

**Applications**

- ✓ Switch to Switch interface
- ✓ 1.25 Gigabit Ethernet over Cat 5 cable

**Descriptions**

SFP - TX 1000BASE-T Copper Small Form Pluggable (SFP) transceivers are based on the SFP Multi Source Agreement (MSA). They are compatible with the Gigabit Ethernet and 1000BASE-T standards as specified in IEEE Std 802.3. The 1000BASE-T physical layer IC (PHY) can be accessed via I2C, allowing access to all PHY settings and features.

Through Copper SFP transceiver, the 1000BASE-X fiber Auto-negotiation on the host board side is transparently converted to 1000BASE-T Auto-negotiation on the copper side. The host systems used to work with fiber SFPs will also work with copper SFPs, so there is no need to change MAC software. The copper SFP also provides with tri-speed mode, 10/100/1000 Mbps operation over 1.25 GHz serial interfaces, as long as the host system supports the SGMII interface without clocks.

**Notes:**

- TX Fault is open collector/drain output which should be pulled up externally with a 4.7KΩ-10KΩ resistor on the host board to supply <math>V\_{ccT} + 0.3V</math> or <math>V\_{ccR} + 0.3V</math>. When high, this output indicates a laser fault of some kind. Low indicates normal operation. In the low state, the output will be pulled to <math>< 0.8V</math>.
- TX Disable input is used to shut down the laser output per the state table below. It is pulled up within the module with a 4.7KΩ-10KΩ resistor.
 

Low (0 – 0.8V):	Transmitter on
Between (0.8V and 2V):	Undefined
High (2.0 – VccT):	Transmitter Disabled
Open :	Transmitter Disabled

3. Mod-Def 0, 1, 2. These are the module definition pins. They should be pulled up with a 4.7KΩ-10KΩ resistor on the host board to supply less than  $V_{ccT}+0.3V$  or  $V_{ccR}+0.3V$ .  
 Mod-Def 0 is grounded by the module to indicate that the module is present.  
 Mod-Def 1 is clock line of two wire serial interface for optional serial ID.  
 Mod-Def 2 is data line of two wire serial interface for optional serial ID.
4. LOS (Loss of Signal) is not available and tied to ground..
5. RD-/+: These are the differential receiver outputs. They are AC coupled 100Ω differential lines which should be terminated with 100Ω differential at the user SERDES. The AC coupling is done inside the module and thus not required on the host board.
6. VccR and VccT are the receiver and transmitter power supplies. They are defined as  $3.3V\pm 5\%$  at the SFP connector pin. The in-rush current will typically be no more than 30mA above steady state supply current after 500ns.
7. TD-/+: These are the differential transmitter inputs. They are AC coupled differential lines with 100Ω differential termination inside the module. The AC coupling is done inside the module and is thus not required on host board.

### Absolute Maximum Ratings

Stresses in excess of the absolute maximum ratings can cause permanent damage to the device. These are absolute stress ratings only. Functional operation of the device is not implied at these or any other conditions in excess of those given in the operational sections of the data sheet. Exposure to absolute maximum ratings for extended periods can adversely affect device reliability.

Notes:

1. Internally AC coupled and terminated to 100Ω differential load.
2. Internally AC coupled, but requires a 100Ω differential termination or internal to Serializer/Deserializer.
3. Pulled up externally with a 4.7KΩ-10KΩ resistor on the host board to  $V_{CCT,R}$ .
4. Mod\_Def1 and Mod\_Def2 must be pulled up externally with a 4.7KΩ-10KΩ resistor on the host board to  $V_{CCT,R}$ .

Digital Diagnostic Memory Map

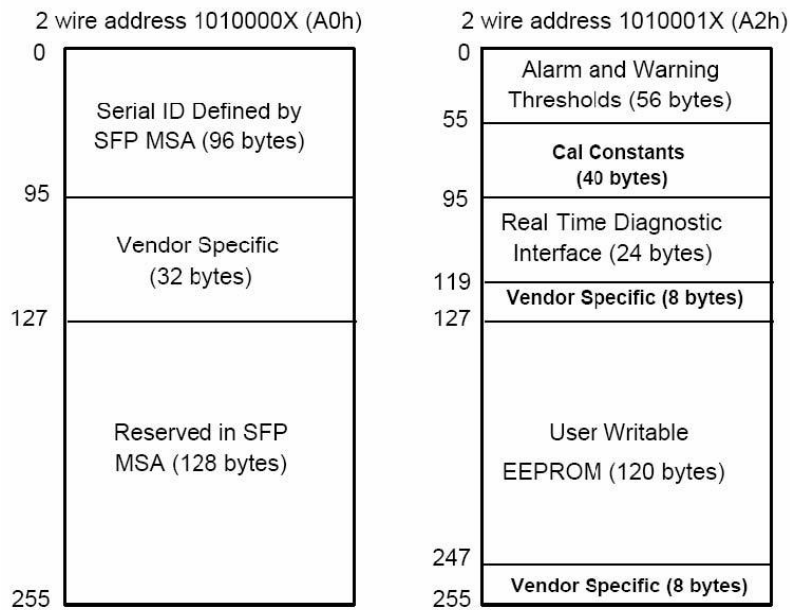

Figure 2. Digital Diagnostic Memory Map Specific Data Field Descriptions

EEPROM Serial ID Memory Contents

The SFP MSA defines a 256-byte memory map in EEPROM describing the transceiver’s capabilities, standard interfaces, manufacturer, and other information, which is accessible over a 2 wire serial interface at the 8-bit address 1010000X (A0h), and the clock frequency up to 100KHz. The memory contents are shown in Table 8.

**Required Host Board Components**

The MSA power supply noise rejection filter is required on the host PCB to meet data sheet performance. The MSA filter incorporates an inductor which should be rated 400mA DC and 1Ω serial resistance or better. It should not be replaced with a ferrite. The required filter is illustrated in Figure 3.

The MSA also specifies that 4.7KΩ to 10KΩ pull-up resistors for TX\_FAULT, LOS, and MOD\_DEF0,1,2 are required on the host PCB. Figure is the suggested transceiver/host interface.

Figure 3 shows the recommended host board power supply circuit.
